Questions

Question 1

First, we will make a table to view the salaries of the NBA players in descending order by using the "select" and "arrange" functions to display the variables we want, in the order we want.

```
## # A tibble: 417 x 2
##    player          salary
##    <chr>           <dbl>
##  1 Kobe Bryant       25
##  2 Joe Johnson       24.9
##  3 LeBron James      23.0
##  4 Carmelo Anthony   22.9
##  5 Dwight Howard     22.4
##  6 Chris Bosh        22.2
##  7 Chris Paul        21.5
##  8 Kevin Durant      20.2
##  9 Derrick Rose      20.1
## 10 Dwyane Wade       20
## # ... with 407 more rows
```

From the table it is visible that Kobe Bryant has the highest salary of all the NBA players at $25 million.

Question 2

Now we will create a boxplot that compares the distribution of the players' salaries by position.

NBA Salaries 2015–2016 by Position
From this graph, we are able to see that the highest median salary is earned by players with the center position, while the lowest median comes from the shooting guard players. The ones who play center, however, also have a more even spread of their salaries, seeing as their interquartile range, or the middle 50%, is the largest of all the positions. There are also very little outliers in the center players' salaries, and there are several high outliers in all four of the other positions, so that is not to say that players playing a position other than center cannot earn a high salary.

Question 3

Now we will take a look at how many players there are in each position with "group_by" and the "count" function.

```
## # A tibble: 5 x 2
## # Groups:   position [5]
##   position     n
##   <chr>    <int>
## 1 SG          96
## 2 SF          82
## 3 PG          85
## 4 PF          85
## 5 C           69
```

Number of Players in each Position
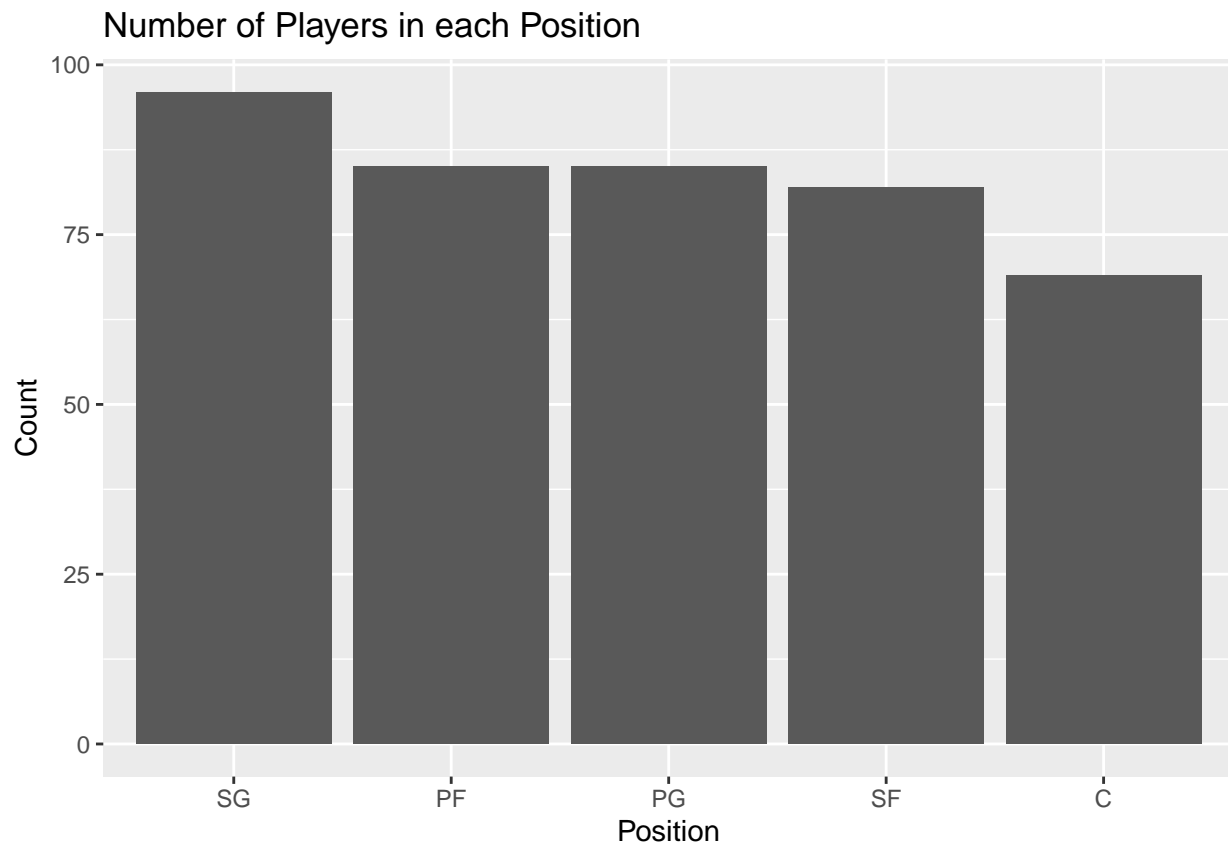

With this table and bar graph, it is visible that there are the most players in shooting guard at 96, while the center position has only 69, which is the least amount of players playing a certain position.
